

A2
communication to a frequency measurement object for using quality measurement of the radio link of the different frequency carrier. In this method, since communication and measurement of the different frequency carrier are not performed simultaneously, it can be adapted by switching of the radio frequency and it is not necessary to separately provide a radio machine for measuring the different frequency carrier.

Please enter the following amended claims:

A2
1. (Amended) A mobile communication system comprising:
transmission control means for providing a vacant period, in which no communication data is present, in one or more of communication frames, and inserting a first control signal which includes a pilot signal to be used for a transmission power control for a forward link in said vacant period.

C1
A3
3. (Amended) A mobile communication system as set forth in claim 2, wherein said time interval of said first control signal inserted during said vacant period is set to be longer than a time interval of said first control signal in a communication mode where transmission data are present in said communication frame which does not include any vacant periods

4. (Amended) A mobile communication system as set forth in claim 1, wherein said transmission control means provides a vacant period from a timing immediately after a second control signal which includes a pilot signal to be used for a transmission power control for a forward link.

6. (Amended) A mobile communication system as set forth in claim 1, wherein said transmission control means transmits a third control signal which includes a pilot signal to be used for a transmission power control for a forward link immediately after end of said vacant period.

8. (Amended) A mobile communication system as set forth in claim 4, wherein said second control signal includes a pilot signal to be used for a transmission power control for a forward link.

9. (Amended) A mobile communication system as set forth in claim 6, wherein said third control signal includes a pilot signal to be used for a transmission power control for a forward link.

11. (Amended) A mobile communication system as set forth in claim 4, wherein said second control signal includes a transmission power control information for reverse link.

a7
14. (Amended) A mobile communication system as set forth in claim 4, wherein said second control signal includes a pilot signal to be used for a transmission power control for a forward link and a transmission power control information for reverse link.

15. (Amended) A mobile communication system as set forth in claim 6, wherein said third control signal includes a pilot signal to be used for a transmission power control for a forward link and a transmission power control information for reverse link.

a8
25. (Amended) A communication control method comprising:
a step of providing a vacant period, in which no communication data is present, in one or more of communication frames, and
a step of inserting a first control signal which includes a pilot signal to be used for a transmission power control for a forward link in said vacant period, for transmission.

a9
27. (Amended) A communication control method as set forth in claim 26, wherein said time interval of said first control signal inserted during said vacant period is set to be longer than a time interval of said first control signal in a communication mode where transmission data are present in said communication frame which does not include any vacant periods.

a9
cancel
28. (Amended) A communication control method as set forth in claim 25, wherein in said step of providing the vacant period, said vacant period is provided immediately after a second control signal which includes a pilot signal to be used for a transmission power control for a forward link.

cancel
30. (Amended) A communication control method as set forth in claim 25, wherein a third control signal which includes a pilot signal to be used for a transmission power control for a forward link immediately after said vacant period.

cancel
32. (Amended) A communication control method as set forth in claim 28, wherein said second control signal includes a pilot signal to be used for a transmission power control for a forward link.

cancel
33. (Amended) A communication control method as set forth in claim 30, wherein said third control signal includes a pilot signal to be used for a transmission power control for a forward link.

cancel
35. (Amended) A communication control method as set forth in claim 28, wherein said second control signal includes a transmission power control information for reverse link.

38. (Amended) A communication control method as set forth in claim 28, wherein said second control signal includes a pilot signal to be used for a transmission power control for a forward link and a transmission power control information for reverse link.

A13
39. (Amended) A mobile communication system as set forth in claim 30, wherein said third control signal includes a pilot signal to be used for a transmission power control for a forward link and a transmission power control information for reverse link.

A14
49. (Amended) A base station in a mobile communication system, comprising:
transmission control means for providing a vacant period, in which no communication data is present in one or more of communication frames, and inserting a first control signal which includes a pilot signal to be used for a transmission power control for a forward link in said vacant period.

A15
51. (Amended) A base station as set forth in claim 50, wherein said time interval of said first control signal inserted during said vacant period is set to be longer than a time interval of said first control signal in a communication mode where transmission data are present in said communication frame which does not include any vacant periods.

56. (Amended) A base station as set forth in claim 52, wherein said second control signal includes a pilot signal to be used for a transmission power control for a forward link.

57. (Amended) A base station as set forth in claim 54, wherein said third control signal includes a pilot signal to be used for a transmission power control for a forward link.

A18

59. (Amended) A base station as set forth in claim 52, wherein said second control signal includes a transmission power control information for reverse link.

62. (Amended) A base station as set forth in claim 52, wherein said second control signal includes a pilot signal to be used for a transmission power control for a forward link and a transmission power control information for reverse link.

63. (Amended) A base station as set forth in claim 54, wherein said third control signal includes a pilot signal to be used for a transmission power control for a forward link and a transmission power control information for reverse link.

72. (Amended) A mobile station in a mobile communication system, comprising:
quality measuring means for receiving a first control signal for maintaining a communication quality transmitted in a vacant period in which no communication data is present, in one or more of communication frames and measuring a reception quality on the basis of said first control signal; and
transmitting means for generating and transmitting a transmission power control information for a forward link according to said reception quality, wherein said first control signal includes a pilot signal to be used for demodulation of the communication data or a transmission power control for a forward link..

73. (Amended) A mobile station in a mobile communication system, comprising:

demodulation means for receiving a first control signal for maintaining a communication quality transmitted in a vacant period in which no communication data is present, in one or more of communication frames and demodulating a communication data using the first control signal, wherein said first control signal includes a pilot signal to be used for demodulation of the communication data or a transmission power control for a forward link..

74. (Amended) A mobile station in a mobile communication system, comprising:

means for receiving a first control signal for maintaining a communication quality transmitted in a vacant period in which no communication data is present, in one or more of communication frames and controlling a transmission power in a reverse link according to said first control signal,

wherein said first control signal includes a transmission power control information for reverse link.

75. (Amended) A mobile station in a mobile communication system, comprising:

quality measuring means for receiving a second control signal for maintaining a communication quality transmitted at a timing immediately before a vacant period in which no communication data is present, in one or more of communication frames and measuring a reception quality on the basis of said second control signal; and

transmitting means for generating and transmitting a transmission power control information for a forward link according to said reception quality,

wherein said second control signal includes a pilot signal to be used for demodulation of the communication data or a transmission power control for a forward link.

76. (Amended) A mobile station in a mobile communication system, comprising:
demodulation means for receiving a second control signal for maintaining a communication quality transmitted at a timing immediately before a vacant period in which no communication data is present, in one or more of communication frames and demodulating a communication data using said second control signal,

wherein said second control signal includes a pilot signal to be used for demodulation of the communication data or a transmission power control for a forward link.

77. (Amended) A mobile station in a mobile communication system, comprising:
means for receiving a second control signal for maintaining a communication quality transmitted at a timing immediately before a vacant period in which no communication data is present, in one or more of communication frames and controlling a transmission power in a reverse link on the basis of said second control signal,

wherein said second control signal includes a transmission power control information for reverse link.

78. (Amended) A mobile station in a mobile communication system, comprising:

quality measuring means for receiving a second control signal for maintaining a communication quality transmitted at a timing immediately before a vacant period in which no communication data is present, in one or more of communication frames and receiving a third control signal for maintaining the communication quality transmitted at a timing immediately after said vacant period, and measuring a reception quality on the basis of said second or third control signal; and

transmitting means for generating and transmitting a transmission power control information for a forward link according to said reception quality,

wherein said second control signal includes a pilot signal to be used for demodulation of the communication data or a transmission power control for a forward link.

79. (Amended) A mobile station in a mobile communication system, comprising:

demodulation means for receiving a second control signal for maintaining a communication quality transmitted at a timing immediately before a vacant period in which no communication data is present, in one or more of communication frames and receiving a third control signal for maintaining the communication quality transmitted at a timing immediately after said vacant period, and demodulating a communication data using said second or third control signal,

wherein said second control signal includes a pilot signal to be used for demodulation of the communication data or a transmission power control for a forward link.

80. (Amended) A mobile station in a mobile communication system, comprising:

wherein said third control signal includes a pilot signal to be used for demodulation of the communication data or a transmission power control for a forward link.

demodulation means for receiving a second control signal for maintaining a communication quality transmitted at a timing immediately before a vacant period in which no communication data is present, in one or more of communication frames and receiving a third control signal for maintaining the communication quality transmitted at a timing immediately after said vacant period, and demodulating a communication data using said third control signal; and

means for controlling a transmission power in a reverse link on the basis of said second control signal,

wherein said third control signal includes a pilot signal to be used for demodulation of the communication data or a transmission power control for a forward link.

82. (Amended) A mobile station in a mobile communication system, comprising:

demodulation means for receiving a second control signal for maintaining a communication quality transmitted at a timing immediately before a vacant period in which no communication data is present, in one or more of communication frames and receiving a third control signal for maintaining the communication quality transmitted at a timing immediately after said vacant period, and demodulating a communication data using said third control signal;

quality measuring means for measuring a reception quality on the basis of said third control signal;

transmitting means for generating and transmitting a transmission power control information in a forward link according to the reception quality; and

means for controlling a transmission power in a reverse link on the basis of said second control signal,

wherein said third control signal includes a pilot signal to be used for demodulation of the communication data or a transmission power control for a forward link.

88. (Amended) A mobile station as set forth in claim 72, wherein said first control signal includes a pilot signal to be used for a transmission power control information for reverse link.
